

# The Digital Revolution and the Hackers Culture.

Elective course  
3rd module (Feb-Mar) 2019

Fabio Grazioso

# Lecture 7/8

# summary

- Historical perspective
  - the evolution of Unix/Linux
- Sociological perspective
  - social media
- Technological perspective
  - text encoding

I think that I will develop in parallel those themes all along the course

# Unix/Linux

historical excursus

# Early steps

- The Unix operating system was created in 1969, at AT&T's Bell Labs (USA) by Ken Thompson, Dennis Ritchie, Douglas McIlroy, and Joe Ossanna
- When it was first released Unix was written in “machine language”.
- Later in 1973, it was rewritten in the C programming language by Dennis Ritchie, a high-level language. This made its porting to different computer platforms easier.
- In the meanwhile, AT&T had some legal problems (antitrust) and was forced to make the source code public.
- As a result, Unix became widely adopted by academic institutions and businesses.
- In 1984, AT&T divested itself of Bell Labs, so Bell Labs began selling Unix as a proprietary product, and users were no more legally allowed to modify it.

# UNIX

source: Wikipedia

# Early steps

- In 1983 by **Richard Stallman** started the GNU Project, with the goal of creating a "complete Unix-compatible software system" composed entirely of free software.
- In 1985, Stallman started the Free Software Foundation and wrote the GNU General Public License (GNU GPL) in 1989.
- By the early 1990s, many of the programs required in an operating system (such as libraries, compilers, text editors, a Unix shell, and a windowing system) were completed.

source: Wikipedia

# Early steps

- In 1991, while attending the University of Helsinki, **Linus Torvalds** became curious about operating systems.
- Linus Torvalds has stated that if the GNU kernel had been available at the time (1991), he would not have decided to write his own.
- Torvalds started to study MINIX, an operating system created by Andrew S. Tanenbaum in 1987 as a minimal Unix-like operating system
- MINIX was targeted at students and others who wanted to learn the operating system principles, and the licensing terms prevented it from being free software.
- Frustrated by these restrictions in the licensing of MINIX, Torvalds he began to work on his own operating system kernel, which eventually became the **Linux** kernel.

source: Wikipedia

On 25 August 1991, (at age 21) Linus Torvalds announced this system in a Usenet posting to the newsgroup "**comp.os.minix**."

Hello everybody out there using minix -

I'm doing a (free) operating system (just a hobby, won't be big and professional like gnu) for 386(486) AT clones. This has been brewing since april, and is starting to get ready. I'd like any feedback on things people like/dislike in minix, as my OS resembles it somewhat (same physical layout of the file-system (due to practical reasons) among other things).

I've currently ported bash(1.08) and gcc(1.40), and things seem to work. This implies that I'll get something practical within a few months, and I'd like to know what features most people would want. Any suggestions are welcome, but I won't promise I'll implement them :-)

Linus (torvalds@kruuna.helsinki.fi)

PS. Yes - it's free of any minix code, and it has a multi-threaded fs. It is NOT portable (uses 386 task switching etc), and it probably never will support anything other than AT-harddisks, as that's all I have :-)

— *Linus Torvalds*

source: Wikipedia

# Linux

- In the mid-1990s started the adoption of Linux in production environments, rather than being used only by hobbyists. In particular it started to take off first in the **supercomputing** community, where organizations such as NASA started to replace their increasingly expensive machines with clusters of inexpensive commodity computers running Linux.
- Commercial use began when Dell and IBM, followed by Hewlett-Packard, started offering Linux support to escape Microsoft's monopoly in the desktop operating system market.
- Today, Linux systems are used throughout computing, from embedded systems to virtually all **supercomputers**, and have secured a place in the market of **internet servers**.
- Use of Linux distributions in home and enterprise **desktops** has been growing. Linux distributions have also become popular in the **netbook** market, with many devices shipping with customized Linux distributions installed.
- Linux's greatest success is the **mobile device** market, with **Android** being one of the most dominant operating systems on smartphones.
- Linux **gaming** is also on the rise with Valve showing its support for Linux and rolling out its own gaming oriented Linux distribution.
- Linux distributions have also gained popularity with various local and **national governments**, such as the federal government of **Brazil**.

source: Wikipedia

# Linux internal design

- Linux is a modular Unix-like operating system, deriving much of its basic design from Unix.
- It has a monolithic kernel, the Linux kernel, which handles process control, networking, access to the peripherals, and file systems.
- Device drivers are either integrated directly with the kernel, or added as modules that are loaded while the system is running.
- It also incorporates the C programming language library functions.
- The system also includes a popular Command Language Interface (CLI) “shell”, i.e. a text-commands based interface.
- The graphical user interface (GUI) used by most Linux systems is built on top of an implementation of the X Window System.
- Many other open-source software projects contribute in a “modular” way to Linux.

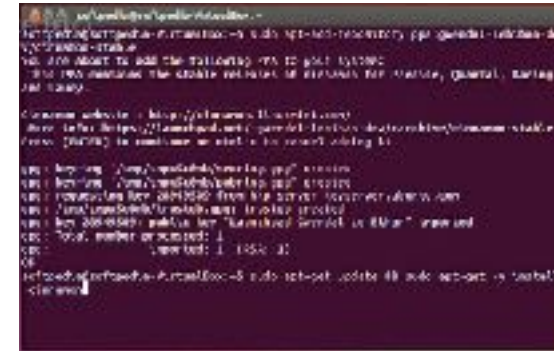

source: Wikipedia

# Linux appearance

- The user interface, also known as the shell, can be a **command-line interface** (CLI), or a **graphical user interface** (GUI).
- CLI shells are text-based user interfaces, which use text for both input and output. The dominant shell used in Linux is the Bourne-Again Shell (bash), originally developed for the GNU project. The CLI is particularly suited for automation of repetitive or delayed tasks, and provides very simple inter-process communication.

```

# Linux appearance

- For recent desktop systems, the default user interface is usually **graphical**, although the CLI is commonly available through terminal emulator windows or on a separate virtual console.
- The most popular graphical user interfaces, called also desktop environments, are KDE Plasma, GNOME, MATE, Cinnamon, Unity, LXDE, Pantheon and Xfce, though a variety of additional user interfaces exist.
- Most popular user interfaces are based on the X Window System, often simply called "X".
- Several types of window managers exist for X11.
- Window managers provide means to control the placement and appearance of individual application windows, and interact with the X Window System.

# Linux Family Tree

Source: <http://upload.wikimedia.org/wikipedia/commons/8/8c/Gldt.svg>

# Slackware

- Slackware is a Linux distribution created by Patrick Volkerding in 1993.
- Originally based on Softlanding Linux System, Slackware has been the basis for many other Linux distributions, most notably the first versions of SUSE Linux distributions, and is **the oldest distribution that is still maintained**.
- Slackware aims for design **stability** and **simplicity** and to be the most "Unix-like" Linux distribution. In contrast to most modern Linux distributions, Slackware provides **no graphical installation procedure** and no automatic dependency resolution of software packages. It uses plain text files and only a small set of shell scripts for configuration and administration. Without further modification it boots into a command-line interface environment.
- Because of its many conservative and simplistic features, Slackware is often considered to be **most suitable for advanced and technically inclined Linux users**.
- Slackware is available for the IA-32 and x86\_64 architectures, with a port to the ARM architecture. While Slackware is mostly free and open source software, it does not have a formal bug tracking facility or public code repository, with releases periodically announced by Volkerding.
- There is no formal membership procedure for developers and Volkerding is the primary contributor to releases.

# Debian

- Debian is a Unix-like operating system consisting entirely of **free software**. Ian Murdock started the Debian Project on August 16, 1993.
- Debian 0.01 was released on September 15, 1993, and the first stable version, 1.1, was released on June 17, 1996.
- The Debian stable branch is the **most popular edition for personal computers** and network servers, and is used as the basis for many other distributions.
- Debian is one of the **earliest** operating systems based on the Linux kernel. The project's work is carried out over the Internet by a team of volunteers guided by the Debian Project Leader and three foundational documents: the Debian Social Contract, the Debian Constitution, and the Debian Free Software Guidelines.
- Debian has been openly developed and freely distributed **according to the principles of the GNU Project** founded by Richard Stallman.
- This philosophy drew the support of the Free Software Foundation, which sponsored the project from November 1994 to November 1995.
- When the sponsorship ended, the Debian Project formed **Software in the Public Interest** to continue financially supporting development.

source: Wikipedia

# Red Hat

- Red Hat, Inc. is an American multinational software company providing open-source software products to the enterprise community. Founded in 1993, Red Hat has its corporate headquarters in Raleigh, North Carolina, with other offices worldwide.
- Red Hat has become associated to a large extent with its enterprise operating system Red Hat Enterprise Linux and with the acquisition of open-source enterprise middleware vendor JBoss. Red Hat also offers Red Hat Virtualization (RHV), an enterprise virtualization product. Red Hat provides storage, operating system platforms, middleware, applications, management products, and support, training, and consulting services.
- Red Hat creates, maintains, and contributes to many free software projects. It has acquired several proprietary software product codebases through corporate mergers and acquisitions and has released such software under open-source licenses. As of March 2016, Red Hat is the second largest corporate contributor to the Linux kernel version 4.14 after Intel.
- On October 28, 2018, **IBM** announced its intent to acquire Red Hat for \$34 billion.

source: Wikipedia

# Ubuntu

- Ubuntu is a free and open-source Linux distribution **based on Debian**. Ubuntu is officially released in three editions: Desktop, Server, and Core (for IoT devices and robots).
- Ubuntu is a popular operating system for cloud computing, with support for OpenStack.
- Ubuntu is released **every six months**, with long-term support (LTS) releases every two years. The latest release is 18.10 ("Cosmic Cuttlefish"), and the most recent long-term support release is 18.04 LTS ("Bionic Beaver"), which is supported until 2028.
- Ubuntu is developed by Canonical and the community under a **meritocratic governance model**. Canonical provides security updates and support for each Ubuntu release, starting from the release date and until the release reaches its designated end-of-life (EOL) date.
- Canonical **generates revenue** through the sale of **premium services** related to Ubuntu.
- Ubuntu is named after the **African philosophy** of ubuntu, which Canonical translates as "humanity to others" or "I am what I am because of who we all are".

# Social media

# Facebook studies

- The social impact of social media is studied by a large community of scholars
- In the 2012 review article: “A Review of Facebook Research in the Social Sciences”, by Wilson et al., the authors group the over 400 articles they study in 5 categories:
  - descriptive analysis of users,
  - motivations for using Facebook,
  - identity presentation,
  - the role of Facebook in social interactions,
  - privacy and information disclosure

# **Descriptive analysis of users**

Who is using Facebook, and what are users doing  
while on Facebook?

Wilson et al., "A Review of Facebook Research in the Social Sciences" (2012)

# statistics

- 1.52 billion daily active users on Facebook on average for December 2018
- 2.32 billion monthly active users on Facebook as of December 31, 2018

(source: Facebook)

<https://newsroom.fb.com/company-info/>

# Motivations for using Facebook

Why do people use Facebook?

# Motivations for using Facebook

- external press
- internal motivations
- Minimizing loneliness
- relieve boredom

Wilson et al., “A Review of Facebook Research in the Social Sciences” (2012)

One subcategory emphasized the external press that encouraged users to engage in Facebook-related behaviors, such as the features on the site like the birthday reminder or automatic e-mails sent by Facebook to users

However, the majority of articles fell into another subcategory, which focused on internal motivations for Facebook use, such as the need for social engagement

Together, these studies demonstrate that a complex relationship exists between differing types of user engagement and the consequent benefits gained from Facebook use. Future studies are needed to map the intricacies of this relationship and to unpack the psychological processes that drive them.

It is equally clear that researchers do not know exactly why Facebook has become so popular

# Identity presentation

How are people presenting themselves on  
Facebook?

# Identity presentation

- [...] research has supported this finding, concluding that although some self-enhancement may occur, profile owners are generally portraying [a fairly accurate representation of their offline identity](#) (Waggoner, Smith, & Collins, 2009; Weisbuch, Ivcevic, & Ambady, 2009).
- Offline relationships tend to lead to Facebook Relationships, rather than the other way around.
- cuLtural norms may also influence how users portray themselves on Facebook.

Wilson et al., "A Review of Facebook Research in the Social Sciences" (2012)

Unlike many other social networking sites (e.g., Badoo, Habbo), offline relationships tend to lead to Facebook relationships, rather than the other way around (Lampe et al., 2006; Ross et al., 2009). Therefore, if an owner presented inaccurate or enhanced information on their Facebook profile, their online friends, who also know the user from offline contexts, would realize that the user was not telling the truth

Assumptions about the perceived audience as well as cultural norms may also influence how users portray themselves on Facebook. One study showed that students in the United States were more inclined than German students to post inappropriate content on Facebook (Karl, Peluchette, & Schlaegel, 2010a, 2010b), which parallels previous research on differing conventions between the two countries (Hofstede, 1991) and points to the influence of cultural norms on Facebook identity construction.

# **The role of Facebook in social interactions**

How is Facebook affecting relationships among  
groups and individuals?

# The role of Facebook in social interactions

- Relationships between companies and customers
- Student–faculty relation- ships
- Interactions between businesses and employees
- Tension across social spheres (overlapping social groups)

Wilson et al., “A Review of Facebook Research in the Social Sciences” (2012)

# Privacy and information disclosure

Why are people disclosing personal information on  
Facebook despite potential risks?

# Privacy and information disclosure

- Facebook administrators have the incentive to keep security and access controls weak by design in order to encourage information exchange and increase their company's value to advertisers.
- Facebook has both a comprehensive privacy-protection architecture and significant privacy problems
- [...] Awareness of privacy and security issues had increased, [...] users' attitudes shifted toward greater privacy concern over time.

Wilson et al., "A Review of Facebook Research in the Social Sciences" (2012)

# **text files and text encodings**

# Binary files

a file is a container of information. A “piece”, a part of information.

And it is stored somewhere.

Specially when the data is a big amount of data, we just use binary numbers, one after the other, to store these data.

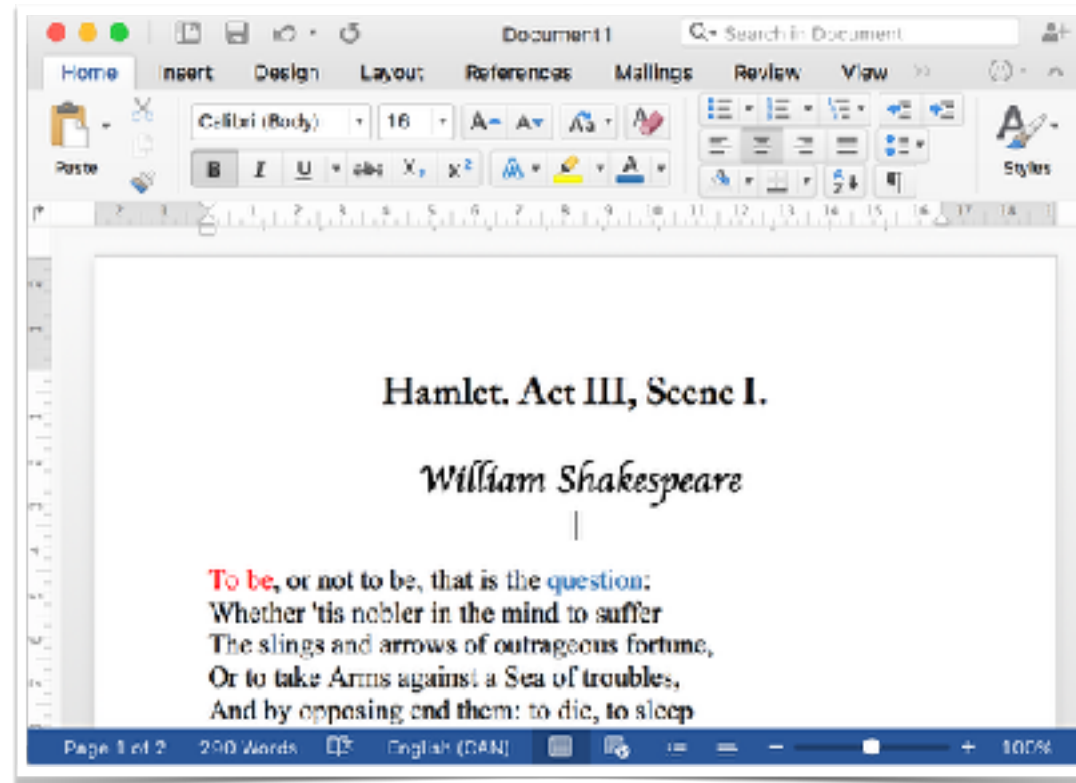

# Edit (visualize) Binary files

one of the first encodings (1963)

ASCII specifies a correspondence between digital bit patterns and character symbols

# ascii encoding

- The best known and most widely used character encoding standard is the **American Standard Code for Information Interchange** (ASCII).
- The first version of ASCII was published in **1964** as a standard way of representing textual data in computer memory and sending it over communication links between computers.
- ASCII is based on a **seven-bit byte**. Each byte represented a character, and characters were represented by assigning them to individual binary numbers.

# ascii encoding

what is the highest value that we can write with 7 binary digits?

$2^6 \ 2^5 \ 2^4 \ 2^3 \ 2^2 \ 2^1 \ 2^0$   
1111111

$2^7 \ 2^6 \ 2^5 \ 2^4 \ 2^3 \ 2^2 \ 2^1 \ 2^0$   
10000000

$$2^7 = 128$$

# ascii encoding

- Perhaps the main deficiency in ASCII comes from the “A” in its name: **American**. ASCII is an American standard, and was designed for the storage and transmission of English text. 95 characters are sufficient for representing English text, barely, but that’s it. On early teletype machines, ASCII could also be used to represent the accented letters found in many European languages, but this capability disappeared in the transition from teletypes to **CRT terminals**.

# Unicode

- Unicode is the latest of several attempts to solve this Tower of Babel problem by creating a universal character encoding.
- Its main way of doing this is to increase the size of the possible encoding space by **increasing the number of bits used to encode each character**.
- Most other character encodings are based upon an **eight-bit byte**, which provides enough space to encode a maximum of **256 characters** (in practice, most encodings reserve some of these values for control signals and encode fewer than 256 characters).

# Unicode

- Unicode uses a 16-bit word to encode characters, allowing up to 65,536 characters to be encoded. 65,000 characters, with careful management, is enough to allow encoding of the vast majority of characters in the vast majority of written languages in use today.
- The current version of Unicode, version 3.2, actually encodes 95,156 different characters—it actually does use a scheme to represent the less-common characters using two 16-bit units, but with 50,212 characters actually encoded using only a single unit, you rarely encounter the two-unit characters. In fact, these 50,212 characters include all of the characters representable with all of the other character encoding methods that are in reasonably widespread use.

# UTF-8

- UTF-8 is a variable width character encoding capable of encoding all 1,112,064 valid code points in **Unicode** using one to four 8-bit **bytes**.
- The name is derived from Unicode Transformation Format – 8-bit.
